Explanations & evidence

Numbered points link to the explanations below. Provisional figures and illustrative capabilities remain qualified.

Computing’s third great transformation

We may be living through the start of computing’s third great transformation.

Personal computing made computing power widely accessible. The internet connected people, information and businesses. Conversational and agentic AI is beginning to change how people interact with computers and what computers can do for them.

It is the combination of dialogue, reasoning support and action capability that matters here. The possible impact could rival earlier transformations, but its scale, timing and distribution remain uncertain.

1980S–1990S · COMPUTING

Personal computing

People operate computers.

Personal computers put general-purpose software on desks and in homes. People operated applications to create digital work. The internet and AI (Artificial intelligence) build on that foundation.

1990S–2000S · CONNECTIVITY

The internet

People navigate the digital world.

Websites, search, email and online services connected people and businesses. Customers learned to find information and work across different interfaces.

2020S ONWARDS · INTELLIGENCE

Conversational and agentic AI

People collaborate with computers.

Generative AI creates content. Large language models support dialogue. Agents can use connected tools within defined permissions. A fluent conversation does not establish reliability or authority.

01.01

Adoption, commercial growth and investment

A major commercial industry is emerging at extraordinary speed. The panels below use bounded, dated examples. They are different measures, not a market-share comparison or a claim that economic transformation is complete.

ADOPTION

34%

U.S. adults who had ever used ChatGPT

Historical survey: February–March 2025. Not all generative AI or active use.

U.S. adults who had ever used ChatGPT · % of U.S. adults · February–March 2025

Observation	Value	Basis
Ever used	34	observed
Had not used	66	derived: 100−34

Definitions, method & limitations N01 ↗

COMMERCIAL GROWTH

US$1bn → >US$5bn

Anthropic annualised company revenue

Company-reported historical run rates: beginning of 2025 to August 2025. Not full-year revenue or profit.

Anthropic company run-rate revenue · US$ billions, annualised · 2025 historical observations

U.S. private AI investment · US$ billions · 2025

Observation	Value	Basis
2025	285.9	reported historical estimate

Definitions, method & limitations N03 ↗

What the evidence cannot tell us

Rapid adoption and spending do not guarantee profitable business models, reliable systems or proportional productivity gains. Existing devices and internet infrastructure make trying an AI service easier than adopting an entirely new computing platform.

The historical eras overlap. A comparison across technologies depends on the population, survey question, geography and starting point. There is no universal adoption clock.

Notes & sources N04 ↗

THE THOUGHT TO TAKE FORWARD

People are beginning to use computers differently: exploring problems in conversation and increasingly asking software to get things done. What happens to the customer relationship when that becomes familiar?

The customer relationship is changing

The customer relationship is moving beyond the supplier's website.

Customers can explore a problem, develop a decision and interact with businesses within a chosen AI (Artificial intelligence) environment, sometimes before a supplier knows that an opportunity exists.

Today, a customer may move among search, supplier websites, portals, email and phone. A connected assistant can bring parts of that work into a continuing conversation. Search and supplier websites will also keep evolving.

SITUATION 01 · ILLUSTRATION

Thinking without a supplier

"Why is this room always cold?"

A customer explores a heating problem, budget and preferences before considering a supplier. The conversation may shape later demand. This is a fictional example.

SITUATION 02 · ILLUSTRATION

Identifying and comparing

"What are my options, and how do they differ?"

An assistant can help identify suppliers and comparison criteria. Missing information, errors and commercial incentives still matter. Being mentioned is not the same as being recommended.

SITUATION 03 · ILLUSTRATION

Working with a known supplier

"Help me prepare this request for our supplier."

The customer deliberately opens an authorised supplier service. It exposes only the information and actions actually supported. This is different from spontaneous recommendation; no particular Swagelok plugin is assumed.

02.01

The customer and their assistant

With permission, relevant history, preferences and project context can sit alongside a supplier’s approved information, specialist knowledge and connected services. The three situations can overlap; they are not a compulsory funnel.

02.02

Three reasons to stay

Continuity: retain useful context where the system supports it and the user permits it. Convenience: research, comparison and authorised actions may be available in one place. Intelligence: combine general reasoning with approved specialist knowledge and current business information.

Leaving the assistant does not necessarily mean losing intelligence: a supplier website may use equivalent models. The practical friction may be repeating accumulated context or interrupting the workflow.

Notes & sources N05 ↗

02.03

Chosen does not mean controlled

Memory and personalisation depend on settings, access and platform rules. Familiarity or feeling understood does not establish correctness, better decisions or durable loyalty. Paid access does not by itself establish freedom from advertising or commercial influence.

A study of ChatGPT consumer use found practical guidance, information seeking and writing to be prominent activities. That supports a broader view of use than search alone; it does not prove improved decisions or reveal any individual customer's private conversations.

Notes & sources N06 ↗

THE THOUGHT TO TAKE FORWARD

Businesses have spent decades persuading customers to come to them. In an AI-mediated economy, businesses may increasingly need to go to the customer's AI.

Three questions for every business

Three questions every business owner should be asking.

As customers increasingly think, make decisions and interact with businesses through AI, three questions become useful. They are overlapping business capabilities, not a compulsory sequence.

01 · WILL AI DISCOVER US?

Discover

Will AI (Artificial intelligence) identify your business when you're relevant to a customer's needs?

Make service areas and capabilities clear in authoritative, machine-readable information. This may help an assistant recognise a relevant business, but cannot guarantee inclusion or ranking.

02 · WILL AI UNDERSTAND US?

Understand

Can AI accurately understand your products, capabilities and what makes you different?

Publish current capabilities, distinctions and supporting evidence. An assistant should be able to tell what you do, where you do it and what makes you different. Being named is not enough.

03 · CAN CUSTOMERS WORK WITH US?

Do Business

Can customers interact with your services without leaving their preferred AI environment?

Approved tools can support enquiries, quotation requests or transactions where implemented. APIs define software interfaces; MCP (Model Context Protocol) connects tools and context; A2A (Agent2Agent) supports agent coordination. None grants commercial authority.

03.01

The competitive implication

Businesses that are easier for AI to discover, understand and work with may gain an advantage over equally capable competitors that remain difficult to access. This is a strategic proposition, not demonstrated revenue uplift or a universal instruction to build an agent immediately.

Notes & sources N07 ↗

03.02

What makes these capabilities possible?

Discover: clear, machine-readable information, evidence on visibility and a useful understanding of commercial questions. Understand: structured identity, authoritative sources, verified claims and a clear match between capabilities and customer requirements. Do Business: approved plugins and tools, integration, identity, authorisation and human approval.

A tool connection can retrieve information or invoke a service. It does not establish autonomous agency. A plugin available for deliberate use does not guarantee spontaneous recommendation.

Notes & sources N07 ↗

THE THOUGHT TO TAKE FORWARD

How much of this is already real? The next chapter separates documented market examples from near-term possibilities and more speculative workflows.

From conversation to commercial action

AI (Artificial intelligence) is starting to do business, not just talk about it.

Connected assistants can bring information and specific business actions into a conversation. The important questions are what the service can actually do, for whom, and under whose authority.

The examples below distinguish an announcement, a documented checkout route and a development capability. None establishes that SR3H has built the corresponding service.

MARKET · ANNOUNCED CAPABILITY

Walmart

A retailer brings shopping closer to the conversation.

Walmart's October 2025 announcement described planned shopping through ChatGPT. It establishes intent, not today's availability. Geography, account requirements, Sparky integration, checkout and fulfilment still need a current end-to-end check.

Notes & sources N09 ↗

MARKET · DOCUMENTED ROUTE

Shopify

Discovery and checkout can be different steps.

Shopify documents ChatGPT as a discovery channel, with checkout on the merchant's store in an in-app browser or new web tab. Other supported channels may offer direct checkout. Merchant and country eligibility vary; no purchase was tested here.

Notes & sources N10 ↗

PLATFORM · DEVELOPMENT CAPABILITY

ChatGPT plugins

Connect approved tools, information and services.

OpenAI documents plugins that connect instructions, tools and services through MCP (Model Context Protocol). Actions depend on installation, authentication and permissions. This does not establish that a Swagelok service is published or authorised to place orders.

Notes & sources N08 ↗

04.01

Three horizons, viewed from October 2026

Today: bounded connected services, with capability and eligibility established separately for each market example. Next 12 months: richer controlled workflows, such as preparing a specialist quotation, are possibilities to examine through October 2027. Beyond: independently operated agents may coordinate authorised work. These are scenarios, not delivery commitments.

01 Today: bounded, documented services

02 Next 12 months: possible controlled workflows

03 Beyond: potential agent coordination

04.02

A possible industrial workflow

A maintenance system identifies a need. A purchasing agent receives an approved requirement, budget and delivery constraints. An approved supplier service consults authoritative product information and, only where connected and permitted, customer-specific pricing and stock.

The systems clarify permitted ambiguities and prepare a proposal. A person gives required approval. An accepted order is recorded in the authoritative systems. Exceptions, technical suitability and safety go to qualified people.

01 Approved requirement

02 Supplier information

03 Clarify and propose

04 Human approval

05 Authoritative record

Notes & sources N11 ↗

04.03

Connections are not commercial authority

Model Context Protocol (MCP) supports connections to tools and context. Agent2Agent (A2A (Agent2Agent)) supports coordination among independently operated agents, including tasks, status and results. They can complement one another; two organisations exchanging information do not automatically need A2A.

Identity, permissions, reliable data, policy enforcement, approval thresholds, audit records and commercial responsibility remain necessary. Existing procurement platforms, electronic data interchange and sophisticated chatbots already support parts of these processes.

Notes & sources N07 ↗

THE THOUGHT TO TAKE FORWARD

The opportunity is not automation for its own sake. It is a better way for customers to work with a supplier, with specialist judgement and responsibility preserved.

The AI-enabled industrial distributor

PROPOSAL · No pilot agreed.

What could an AI-enabled industrial distributor look like?

How could AI (Artificial intelligence) make an already sophisticated industrial distributor easier to work with, without weakening specialist relationships? Start with the work people already do well and look for an incremental improvement.

These are potential applications for discussion. They do not describe a verified Swagelok Southeast Texas internal process or an agreed pilot.

OPPORTUNITY 01 · PROPOSED

Repeat orders and replenishment

Known products. Established customers. Recurring demand.

Existing portals, ERP, EDI, email and phone may already serve repeat orders well. An assistant could prepare a request using approved history. Confirmation would require identity, current data and authority. No repeat-order percentage or saving is assumed.

OPPORTUNITY 02 · PROPOSED

Modified or more complex orders

Changes in specification. Clarification. Quotation requirements.

Collect the request, clarify missing information and prepare a complete handoff. This may help with iterative or modified enquiries. A person checks the quote; no binding price, stock, suitability or order commitment is implied.

OPPORTUNITY 03 · PROPOSED

Engineered solutions and specialist support

Application knowledge. Design. Technical collaboration.

Organise project context, drawings and questions for a specialist. Qualified people retain responsibility for design, compatibility and safety. Published services do not establish local system access or permission to reuse knowledge.

05.01

A service connected to people and systems

Customer’s assistant → authorised commercial service → Swagelok people and approved systems. Shared product knowledge might be reusable across a network; customer data, prices, inventory and commercial authority must remain appropriately local.

01 Customer’s assistant

02 Authorised commercial service

03 People and approved systems

Notes & sources N12 ↗

05.02

A practical starting point

Consider quotation assistance for one approved product category: structured intake, retrieval from a curated knowledge set, clarification of missing information and a complete handoff to a person. Start alongside existing systems, possibly with controlled uploaded data.

Unchanged repeat requests could be confirmable only within approved limits and with authority. Standard changes prepare a quote; unusual needs go to a specialist; discounts or larger commitments go to an account manager. No order is placed by this briefing.

ILLUSTRATIVE EXAMPLE · LOCAL ONLY

Walk through a quotation request

01 / A request arrives

Fictional customer: “We need the same items as our approved list, with one change.” No real parts, prices or customer records are used.

02 / Clarify the change

Collect the list reference, requested change, quantity and delivery need. Flag technical questions for a qualified specialist; do not infer compatibility.

03 / Prepare the handoff

Organise the request and outstanding questions for a person to review. No quote is issued and no order is placed.

Proposed intake pattern. No live AI, supplier integration or transaction.

Notes & sources N11 ↗

05.03

Measure before claiming an improvement

Potential benefits are better customer experience, greater efficiency, opportunity for growth and a practical starting point. Each is a hypothesis to measure.

Establish a baseline for request completeness, clarification rounds, handling time, customer effort, conversion, specialist capacity and errors. A shorter interaction is not an improvement if it loses important technical information.

Notes & sources N12 ↗

05.04

Questions for our conversation

Where do requests become difficult, and what would this improve rather than duplicate? Which product information and interfaces could be used with permission? Where must technical judgement and commercial approval remain central? What could be reused across distributors, and what must stay local? Is there a narrow, measurable test with an agreed sponsor?

Notes & sources N12 ↗

THE THOUGHT TO TAKE FORWARD

A useful first test would be narrow enough to measure, safe enough to run alongside today’s process, and valuable enough for a customer and the team to choose again.

SR3H's response

IN DEVELOPMENT · Pre-revenue. Commercial model unproven.

Building the services for an AI-mediated world.

A changing world creates an opportunity for individuals and businesses to participate on better terms. SR3H's proposition is to help them take control of how they are discovered, understood and able to interact in an AI-mediated world.

This is a developing commercial proposition. Products and working technology are at differing stages; intended capabilities must be separated from demonstrated functions.

FOR INDIVIDUALS · IN DEVELOPMENT

MyLegend

Your identity. Your rules. Your agent.

Personal identity, an AI-ready presence and authorised interaction across Discover, Understand and Do Business. People choose what to share and which services to connect. This does not promise absolute control over third-party AI (Artificial intelligence).

FOR ORGANISATIONS · IN DEVELOPMENT

MyLegend for Business

Be discoverable. Be understandable. Be ready to do business.

Approved business information, structured representation and supported commercial workflows across Discover, Understand and Do Business. Plugins, MCP (Model Context Protocol) and agent connections are options where appropriate; each capability needs to be demonstrated.

COMMERCIAL INTELLIGENCE · ENABLING CAPABILITY

Signal

Understand how AI sees your market.

Study how AI systems discover, describe and recommend businesses. Compare commercial query responses, investigate gaps and test changes. Signal informs both MyLegend services and may have standalone value. It does not access private customer conversations.

06.01

What we have built

SR3H’s experience is that a small team can conceive, specify and build sophisticated AI-native products quickly. Mandate and ConchUp support requirements, implementation and verification; supporting projects can provide selective demonstrations.

Working demonstrations show particular capabilities; they do not establish production readiness.

Notes & sources N13 ↗

06.02

Where we are now

Paying customers — None yet. Repeatable customer acquisition — Not yet demonstrated. Scalable commercial model — Hypothesis to test.

Paying customers	**None yet**
Repeatable customer acquisition	**Not yet demonstrated**
Scalable commercial model	**Hypothesis to test**

Notes & sources N13 ↗

06.03

A founder’s experience

> I’ve spent much of my professional life building technology businesses. A year ago, if you’d told me that I could personally develop in a week software that would previously have required a team of six to ten people, six to nine months and hundreds of thousands of pounds, I wouldn’t have believed you.
>
> Yet that is what I’ve experienced.
>
> AI has fundamentally changed the economics of the activity on which I’ve built much of my career. I didn’t predict that change, and I certainly don’t pretend to know exactly how AI will transform other industries.
>
> But having experienced it firsthand, I find it difficult to be complacent about what might happen next.
>
> Stephen

Personal account, not an independently audited benchmark.

Notes & sources N14 ↗

06.04

Our next challenge

Validate with real customers. Develop distribution in an AI-mediated environment. Identify repeatable commercial use cases. Build revenue models and iterate from evidence.

The working thesis is that falling software production costs increase the importance of distribution, trust and repeatable adoption. Integration, security, reliable information, operations, accountability and specialist expertise remain valuable and can remain costly. Distribution is not automatically a durable advantage.

06.05

Our belief

Uncertainty about how a transformation will unfold is not a good reason to dismiss the possibility that it will be profound.

What do you see in your own business? Where does this thesis fit, where does it fail, and what might be worth testing together?

THE THOUGHT TO TAKE FORWARD

A changing world. New opportunities. A better conversation in Oxford.

Glossary

Plain-English definitions.

Terms and technologies

AI Artificial intelligence	Software that performs tasks associated with human intelligence, such as recognising patterns, generating language or supporting decisions. Capability in one task does not imply dependable judgement in another.
Generative AI	AI that produces new content, such as text, images, audio or code, from patterns learned during training. A convincing answer can still be wrong.
Large language model LLM	An AI model trained on large amounts of language and other data to generate and process text. It can support dialogue, but its output is not an authoritative record of facts.
Conversational AI	AI designed to interact through dialogue, allowing a person to ask questions, clarify a need and build on earlier exchanges.
Agentic AI	AI systems arranged to pursue a goal through multiple steps, often using tools. The degree of independence depends on design, permissions and approval rules.
AI agent	Software that uses an AI model to choose steps and use available tools toward a goal. An agent can have limited authority; being called an agent does not establish autonomy or reliability.
Personalisation	Adapting responses or services to a person’s preferences or circumstances, using information the system is allowed and able to access.
Memory and context	Context is information available for a particular interaction. Memory is information a service may retain for later use. What is retained, used or forgotten depends on product settings, limits and permission.

Plugin	An installed extension that gives an assistant particular instructions, tools or services. Some connect to an external account. Installing one does not authorise every action or guarantee that it will be recommended.
API Application programming interface	A defined way for one software system to request information or an action from another. Access rules, data quality and business authority still need to be established.
MCP Model Context Protocol	An open standard for connecting AI applications to external information, tools and workflows. It is a connection mechanism, not a permission to transact or proof of autonomous agency.
A2A Agent2Agent	An open protocol through which separately operated AI agents can exchange messages, tasks, status and results. It can complement MCP. Ordinary software integration does not automatically require it.
Structured or machine-readable information	Information organised into explicit fields and relationships that software can interpret, such as a business's name, location and service capabilities. Structure helps interpretation; it does not guarantee accuracy or discovery.
AI-mediated commerce	Commercial discovery, comparison or interaction in which AI helps connect a customer with a business. Checkout may occur inside an assistant, in an embedded browser or on a separate merchant website.
Authorisation	Permission for an identified person or system to perform a specific action within defined limits. Access to information is different from authority to accept a price or place an order.
Human approval	A person explicitly checks and permits a proposed action before it takes effect. The person needs the relevant information and authority; a vague approval prompt is not a substitute for review.

SR3H products

MyLegend	SR3H’s developing service for individuals: identity, representation and authorised interaction across Discover, Understand and Do Business. Proposition: Your identity. Your rules. Your agent.
MyLegend for Business	SR3H’s developing service for organisations, spanning discovery, accurate representation and supported commercial interaction. Proposition: Be discoverable. Be understandable. Be ready to do business.
Signal	SR3H’s commercial-intelligence capability for studying AI responses, market representation and opportunities for improvement. It supports both MyLegend services and may have standalone value; it does not imply access to private conversations.

REFERENCE

Notes & Sources

Evidence, definitions and limitations.

A forecast remains a forecast. A platform feature is not proof of a working SR3H service.

N01 A bounded adoption measure

34% of U.S. adults reported ever using ChatGPT in a February–March 2025 survey.

This establishes substantial reach for one service at a defined date. The remaining share is 66%, derived as 100 minus 34. It is not a current October 2026 estimate, a weekly-use measure or directly comparable to different generative-AI adoption surveys.

Assertion type	Measured survey result
Verification	Checked against primary publication
Actor / maturity	Market · Observed survey
Population / geography	U.S. adults
Observation period	24 February–2 March 2025
Units and definition	Percentage reporting ever using ChatGPT; not active use or all generative AI.
Method / sample	5,123 adults in Pew’s American Trends Panel; weighted to represent the U.S. adult population.
Limits and counterpoints	Different survey questions, populations and starting points cannot be merged into a single adoption curve. No intermediate observations have been invented.
Source / publisher	34% of U.S. adults have used ChatGPT, about double the share in 2023 · Pew Research Center
Publication date	25 June 2025

Source locator	Opening findings and How we did this
Last checked	22 October 2026

Read original source ↗ — https://www.pewresearch.org/short-reads/2025/06/25/34-of-us-adults-have-used-chatgpt-about-double-the-share-in-2023/

N02 Commercial growth, without a company ranking

Anthropic reported run-rate revenue of approximately US$1bn at the beginning of 2025 and over US$5bn by August 2025.

The example illustrates commercial expansion at one company. Annualising a recent sales pace does not establish full-year revenue, profit or a durable business model.

Assertion type	Vendor report
Verification	Checked against original company announcement
Actor / maturity	Market · Reported historical company metric
Population / geography	Company-wide; not a consumer population
Observation period	Beginning of 2025 and August 2025
Units and definition	US$ billions of annualised company run-rate revenue, not recognised full-year revenue or Claude-only revenue.
Method / sample	Two company-reported observations. The second is a lower bound, displayed as >5, not a precise 5.
Limits and counterpoints	Unaudited vendor report. No OpenAI comparison is plotted; reporting dates and cloud-partner revenue accounting require reconciliation. This is a historical example, not the latest October 2026 run rate.
Source / publisher	Anthropic raises US$13B Series F at US$183B post-money valuation · Anthropic
Publication date	2 September 2025
Source locator	Paragraph beginning Anthropic has seen rapid growth

Last checked	22 October 2026

Read original source ↗ — https://www.anthropic.com/news/anthropic-raises-series-f-at-usd183b-post-money-valuation

N03 Investment is not the same as infrastructure expenditure

Stanford’s 2026 AI Index reports US$285.9bn of U.S. private AI investment in 2025.

The figure indicates significant capital allocation. It should not be treated as proof of realised productivity, profitable returns or completed infrastructure spending.

Assertion type	Research compilation
Verification	Checked against primary report summary
Actor / maturity	Market · Historical estimate
Population / geography	United States
Observation period	2025
Units and definition	US$ billions of private AI investment; not global infrastructure capital expenditure.
Method / sample	AI Index compilation. The headline is rounded; no underlying time series is reconstructed here.
Limits and counterpoints	The private-investment measure excludes other categories of spending. No GDP comparison, historical peak comparison or Goldman infrastructure forecast is asserted in this edition.
Source / publisher	The 2026 AI Index Report · Stanford Institute for Human-Centered Artificial Intelligence
Publication date	2026
Source locator	Top takeaway 6: The United States leads in AI investment
Last checked	22 October 2026

N04 The transformation thesis is an interpretation

We may be living through the start of computing's third great transformation.

The three eras overlap. The thesis deliberately retains may. Rapid use can coexist with model errors, uneven productivity and unprofitable services.

Assertion type	Strategic inference
Verification	Interpretation; not an empirical result
Actor / maturity	Market · Prospective
Population / geography	Not a defined survey population
Observation period	2020s onwards
Units and definition	A narrative about changes in interaction and capability, not a measured economic transformation rate.
Method / sample	Synthesis of distinct adoption, commercial and investment observations.
Limits and counterpoints	Existing infrastructure reduces adoption friction. Historical curves depend on denominator and baseline. The source artwork's precise curves and unsupported forecasts are not evidence.
Source / publisher	SR3H transformation thesis · SR3H
Publication date	22 October 2026
Source locator	Chapter 1: computing transformation and evidence
Last checked	22 October 2026

SR3H account or interpretation.

N05 Continuity, permissions and trust

A continuing AI conversation may reduce repeated context when the service supports it and the user permits it.

Customers may benefit from carrying preferences and project context across steps. Websites may use equivalent models, and supplier expertise remains important.

Assertion type	Strategic inference and illustration
Verification	Qualified proposition
Actor / maturity	Platform-dependent · Not universal
Population / geography	Varies by service, account and jurisdiction
Observation period	October 2026 briefing horizon
Units and definition	Continuity concerns the relevant context available to the assistant; not unlimited memory or guaranteed correctness.
Method / sample	Illustrative customer situations; no causal performance or loyalty claim.
Limits and counterpoints	Platform rules, memory settings, access limits and commercial incentives apply. Emotional attachment and perceived competence do not establish reliability. No advertising-free promise is made.
Source / publisher	SR3H customer-relationship interpretation · SR3H
Publication date	22 October 2026
Source locator	Chapter 2; fictional examples labelled in the text
Last checked	22 October 2026

SR3H account or interpretation.

N06

Evidence of use beyond search

Practical guidance, information seeking and writing were prominent categories in a study of ChatGPT consumer use.

The research is consistent with customers using conversation to explore needs, rather than only submitting search queries. Applying that observation to a distributor is a strategic inference.

Assertion type	Research finding
Verification	Checked against NBER publication abstract
Actor / maturity	Platform · Observed historical consumer usage
Population / geography	ChatGPT consumer sample; not all AI users
Observation period	Launch through July 2025
Units and definition	Classified usage topics; not a measurement of decision quality, conversation duration or customer loyalty.
Method / sample	Privacy-preserving automated classification of sampled conversations; the authors include OpenAI employees. The abstract supports the qualitative statement used here.
Limits and counterpoints	Working paper; company involvement; platform-specific sample. Observed use does not establish causal commercial benefit or access to private customer conversations.
Source / publisher	How People Use ChatGPT — Working Paper 34255 · National Bureau of Economic Research
Publication date	September 2025
Source locator	Abstract; DOI 10.3386/w34255
Last checked	22 October 2026

Read original source ↗ — https://www.nber.org/papers/w34255

N07

Tools, context and agent coordination

MCP connects AI applications to tools and context; A2A supports communication among independently operated agents.

MCP and A2A address different layers and can complement one another. An ordinary API integration may be sufficient for a particular business task.

Assertion type	Protocol documentation
Verification	Checked against original documentation
Actor / maturity	Ecosystem · Protocol capability, not deployment proof
Population / geography	Not geographically defined
Observation period	Documentation checked 22 October 2026
Units and definition	Connection and communication standards do not grant business authority or guarantee autonomous performance.
Method / sample	Official protocol documentation; no integration test.
Limits and counterpoints	Protocol availability does not establish widespread deployment, reliability, economics or SR3H readiness. Identity, authorisation, human approval and audit records remain application responsibilities.
Source / publisher	What is the Model Context Protocol?; What is A2A? · Model Context Protocol; A2A Protocol project
Publication date	Living documentation
Source locator	MCP introduction; A2A introduction and A2A and MCP section
Last checked	22 October 2026

N08 Plugins expose defined capabilities

OpenAI documents plugins that combine skills and MCP connections to tools, data and services.

A supplier may expose approved information and supported actions through a plugin. Installation, authentication, permissions and host behaviour constrain what a customer can do.

Assertion type	Official developer documentation
Verification	Checked against official documentation
Actor / maturity	Platform · Development capability
Population / geography	Account, host and region dependent
Observation period	Checked 22 October 2026
Units and definition	A documented extension mechanism, not a claim that any specific supplier integration is available.
Method / sample	Plugin documentation; no installation or transaction test.
Limits and counterpoints	Documentation alone does not prove that a proposed Swagelok plugin is published or that a current user can transact. Explicit invocation does not guarantee spontaneous recommendation.
Source / publisher	Plugin development for ChatGPT and Codex · OpenAI Developers
Publication date	Living documentation
Source locator	Overview: Get started, core concepts, authentication, connect and test

Read original source ↗ — https://developers.openai.com/plugins

N09 Walmart: announcement versus observed availability

Walmart announced planned ChatGPT shopping with Instant Checkout in October 2025.

The case shows a retailer’s intent to serve customers within an AI environment. It does not demonstrate a currently available end-to-end service for every user.

Assertion type	Vendor announcement
Verification	Original announcement checked; current journey untested
Actor / maturity	Market · Announced; current availability not established here
Population / geography	Current geography and account eligibility not established
Observation period	14 October 2025 announcement
Units and definition	Announcement of a planned capability; not evidence of the exact checkout flow in October 2026.
Method / sample	Company announcement; no account connection, purchase or fulfilment test.
Limits and counterpoints	Later Sparky and external-agent developments require separate checks. The 2025 future-tense announcement is retained as historical evidence only.
Source / publisher	Walmart Partners with OpenAI to Create AI-First Shopping Experiences · Walmart Corporate
Publication date	14 October 2025

N10 Shopify: the actual checkout route matters

Shopify documents ChatGPT as a discovery referrer with merchant checkout in an in-app browser or new web tab.

For ChatGPT, the merchant’s store checkout handles the purchase. Other named supported channels may provide direct checkout when enabled. The case illustrates the need to distinguish discovery from transaction execution.

Assertion type	Vendor documentation
Verification	Checked against Shopify Help Center
Actor / maturity	Market · Documented; not purchase-tested
Population / geography	Eligible merchants and channels; eligibility varies
Observation period	Documentation checked 22 October 2026
Units and definition	Discovery in the AI conversation is distinct from natively completing payment there.
Method / sample	Channel-specific details in Shopify’s agentic storefront documentation.
Limits and counterpoints	Merchant eligibility, regional access, account connection and purchase were not tested. Channel behaviour can change.

N11 A fictional quotation-assistance sequence

A bounded assistant could collect a request, clarify missing information and prepare a human handoff.

One product category and a curated approved knowledge set could bound a test. A person checks the result. Exceptions and safety questions go to qualified specialists.

Assertion type	Illustration and pilot hypothesis
Verification	Not implemented or validated as a supplier service
Actor / maturity	Supplier/SR3H · Proposed
Population / geography	Local distributor context to establish
Observation period	Possible future test; no delivery commitment
Units and definition	A local demonstration of intake steps, not an executable quotation, pricing or order service.
Method / sample	Fictional example only. No customer data, integration, model call, price or technical selection is used.
Limits and counterpoints	No binding price, live inventory, compatibility assessment, order placement or agreement. Permission, sponsor, success criteria and scope must be established first.

N12 Distributor processes and potential benefits

AI-supported service may improve customer effort or request handling; the benefit must be measured against existing processes.

Repeat ordering may already work well. Iterative or modified requests may be a more useful first question. Shared product knowledge does not imply shared prices, customer data, inventory or authority.

Assertion type	Strategic hypothesis
Verification	Local workflow and integration assumptions unverified
Actor / maturity	Supplier · Proposed opportunity
Population / geography	Swagelok Southeast Texas; local applicability unconfirmed
Observation period	October 2026 discussion
Units and definition	Incremental value beyond established portals, ERP, EDI, email, telephone and specialist support.
Method / sample	Potential measures include request completeness, clarification rounds, handling time, customer effort, conversion, specialist capacity and errors, compared with existing process performance.
Limits and counterpoints	No 90% repeat-order statistic, internal-process description, API availability, ROI, agreed pilot or network-wide permission is asserted.

N13 Product positioning and commercial maturity

MyLegend and MyLegend for Business each span Discover, Understand and Do Business; Signal enables commercial intelligence. The briefing describes SR3H as pre-revenue.

Paying customers: none yet. Repeatable acquisition: not demonstrated. Scalable commercial model: hypothesis to test. Signal may have standalone value and assumes no access to private conversations.

Assertion type	Company proposition and management account
Verification	Company account; not independently verified
Actor / maturity	SR3H · Differing development stages
Population / geography	SR3H proposition; no market-wide result
Observation period	Supplied briefing dated 22 October 2026
Units and definition	Positioning and current claimed maturity; not a promise of general availability.
Method / sample	SR3H’s account of its product architecture, demonstrations and commercial maturity.
Limits and counterpoints	A working example does not establish production readiness, adoption, revenue or safety.

N14 Stephen’s first-person experience

Stephen describes personally building software in a week that he previously expected to require a larger team and much longer development.

The experience motivates curiosity about changing software economics. It does not demonstrate equivalent security, maintainability, reliability or production readiness across the compared scopes.

Assertion type	First-person experience
Verification	Personal account; not independently audited
Actor / maturity	SR3H · Personal development experience
Population / geography	Personal UK account; pounds retained
Observation period	Retrospective account in October 2026 briefing
Units and definition	A founder’s experience, not an audited like-for-like productivity benchmark.
Method / sample	First-person account; no independent productivity comparison.
Limits and counterpoints	Scope, effort and the meaning of complete require explanation if numerical comparisons are emphasised. No cost saving, currency conversion or universal multiplier is claimed.
